

# SiF2022: OpenSEES Workshop

**Session 5: Application of localized fire model for performance-based structural fire design**

**Zhuojun Nan**

**The 12th International Conference on Structures in Fire  
SiF 2022, Hong Kong**

# About Me

## Zhuojun NAN

- BSc in Civil Engineering, MSc (UoE) in Structural and Fire Safety Engineering
- Graduate Fire Engineer in Arup (Shanghai)
- A PhD candidate at the Hong Kong Polytechnic University
- Research lies in the influence of localised failures on the global response of structures in realistic fires
- Interested in the application of travelling fires and AI for structural fire safety
- Email me at [zhuojun.nan@connect.polyu.hk](mailto:zhuojun.nan@connect.polyu.hk)

**SureFire**  
Smart Urban Resilience  
and Firefighting

## Outline

1. What is the Hasemi's localized fire?
2. How to apply localized fire model in performance-based structural fire design?
3. How to set-up localized fire model in OpenSEES?
4. Can we use GiD to simulate the thermal and structural responses under localised fire scenarios?

**GiD OpenSees**  
v2.8.0

**An integrated FEA platform**  
*The Thermal Element Version*

School of Civil Engineering, AUTh

## Hasemi's localized fire

- Proposed by Yuji Hasemi in 1996 [1]
- BS EN 1991-1-2:2002 (Annex C) [2]
- Parameters used in Hasemi's localized fire model to calculate heat flux from fire source to the beam.

*Hasemi's localized fire external heat flux  $\dot{h}$  ( $W/m^2$ )*

$$\dot{h} = 100000 \quad \text{if } y \leq 0.30$$

$$\dot{h} = 136300 - 12100y \quad \text{if } 0.30 < y \leq 1.0$$

$$\dot{h} = 15000y^{-3.7} \quad \text{if } y \geq 1.0$$

## Application of Hasemi's localized fire in PBD

Hasemi's localized fire model has been widely applied as the necessary fire scenario in performance-based structural fire design for practical projects.

Especially, for large space steel structures, such as...

- Beijing Daxing International Airport - 2019
- Hangzhou Xiaoshan International Airport T4 - 2022
- Hohhot Shengle International Airport - 2024
- Wintastar Ice World (Shanghai) - 2023

# Application of Hasemi's localized fire in PBD

Current method - Excel

- Design fire scenarios
- Determine distances (horizontally & vertically) between structural members and fire
- Calculating thermal load on structures (i.e., heat transfer analysis)
- FEM - structural response analysis

**1. INPUT PARAMETERS**

Q <sub>o</sub>	8000 kW	Fire Size	T <sub>1</sub> (1.5h)	444 °C
L	0 m	Steel member length	T <sub>2</sub> (2.0h)	457 °C
T <sub>exp</sub>	3600 s	Fire exposure time	T <sub>3</sub> (3.0h)	465 °C
R	105.0 m	steel member section factor		
T <sub>f</sub>	1113.5 °C	Flame temperature		
Q <sub>c</sub>	5600 kW	Convective part of the HRR		
q <sub>o</sub>	300 kW/m <sup>2</sup>	HRR per unit area		
BC	0.25	Convective coefficient		
ρ <sub>s</sub>	7850 kg/m <sup>3</sup>	Steel density		
ε <sub>r</sub>	0.85	Radiation emissivity		
σ	5.67 × 10 <sup>-8</sup> W/m <sup>2</sup> ·K <sup>4</sup>	Boltzmann Constant		

**2. CALCULATION OF THE AIR TEMPERATURE**

D <sub>h</sub>	0 m	Horizontal distance of the member to the fire
D <sub>v</sub>	0 m	Vertical distance of the member to the fire
R	2.256792937 m	Fire radius
Z <sub>1</sub>	3.952862908 m	Height of the flame
Z <sub>0</sub>	-1.58165237 m	Virtual Zero of flame
T <sub>1</sub>	535.2321317 K	Temperature along the flame centerline
T <sub>a</sub>	535.2321317 K	Air temperature around the member
T <sub>total</sub>	6.105 K	Temperature rise

**4. CALCULATION OF THE STEEL TEMPERATURE**

Time	time(min)	T <sub>s</sub>	Q <sub>c</sub>	Q <sub>r</sub>	Q <sub>o</sub>	dt	
174	0	0	30.00	600.00	6364.36	6055.80	2.98
175	10.8	0.18	22.98	600.00	6363.09	5981.19	2.97
176	21.6	0.36	25.95	600.00	6361.79	5907.03	2.95

**Heat Flux Diagrams:**

- J<sub>side</sub>:** Heat flux in the side: Considering symmetry, take half of the entire surface, simplify it into 10 inclined surfaces, calculate the view factors.
- J<sub>top</sub>:** The disk is approximated as a rectangle with a side length of Z<sub>R</sub>, and the view factors can be directly calculated.

**Equations:**

$$\Delta T_s = \frac{A_m/V}{c_p \rho_a} h_{net,r} \Delta t$$

$$h_{net,r} = J \cdot \epsilon \cdot \sigma \cdot [T_f^4 - T_s^4]$$

$$h_{net,c} = \alpha_c \cdot [T_a - T_s]$$

**Graph:** Temperature (°C) vs Time (min) showing a curve that rises from 0°C at 0 min to approximately 450°C at 90 min.

# Set up localized fire model in OpenSEES

Real-scale localized fire experiments - Takashi Wakamatsu and Yuji Hasemi (1997)

Example [http://openseesforfire.github.io/Subpages/Examples/HT2\\_beam.html](http://openseesforfire.github.io/Subpages/Examples/HT2_beam.html)

## OPENSEES FOR FIRE

[Back Home](#) [Download OpenSees](#) [View On GitHub](#)

### Heat transfer of I-section steel beam subjected to localised fire

Developed by Zhuojun Nan

#### Introduction

Figure HT2-2 shows a 6m steel beam subjected to a localised fire which is set just under the centre of the beam. This example is established according to the real-scale localised fire tests reported by Wakamatsu and Hasemi.

Please refer to this paper: [Thermal analysis infrastructure in OpenSees for fire and its smart application interface towards natural fire modelling](#), *Fire Technology*, 2020

OpenSees Model	Type used for this example
HT Entity	Isection3D, I-section (400mm*200mm*13mm*15mm)
Material	CarbonSteelEC3
Fire Type	Localised fire (1127kW)

Download: [This Example Package](#)

#### Model Geometry

The construction size of the real-scale localised fire tests is 6.0m × 6.0m × 3.4m (Ceiling Height). The observed steel beam under the centre of the ceiling is a 150mm(H) × 75mm(W) × 5(Web) × 6mm(Flange) H-shape section. A rectangular gas burner 1.0m × 1.0m was setting in the centre of the floor with 1.0m vertical height. This burner used propane as the fuel. The heat release rates are in equivalent to different fire sizes controlled by the volume of flowing gas and assumed complete combustion. \*The real-scale localised fire tests without protection soffit.

Figure HT-1: Schematic of steel beam subjected to localised fire(Wakamatsu and Hasemi, 1997)

# Set up localized fire model in OpenSEES

## Example Tcl

```
#FireModel - the Eurocode 1 Localised Fire Model
```

```
#$fireTType $fireTag $firePars
```

```
FireModel Localised 1 -origin 0.0 -2.0 $Centrez -firePars 1.0 1127.0E3 2.4 2 ;
```

**-origin** is to set location of fire source:

**locx** (m), **locy** (m), **locz** (m)      *where locz stands for location z*

**-firePars** is to set parameters used in Hasemi's localized fire model:

**equivalent Diameter of fire** (m), **Q** (W), **Ceiling height** (m), **symmetrical axis**

```
#Dimension of beam
```

```
set BF 0.20; #Width of flange (m)
```

```
set HB 0.40; #Height of beam (m)
```

```
set Tw 0.013; #Thickness of web (m)
```

```
set Tf 0.015; #Thickness of flange (m)
```

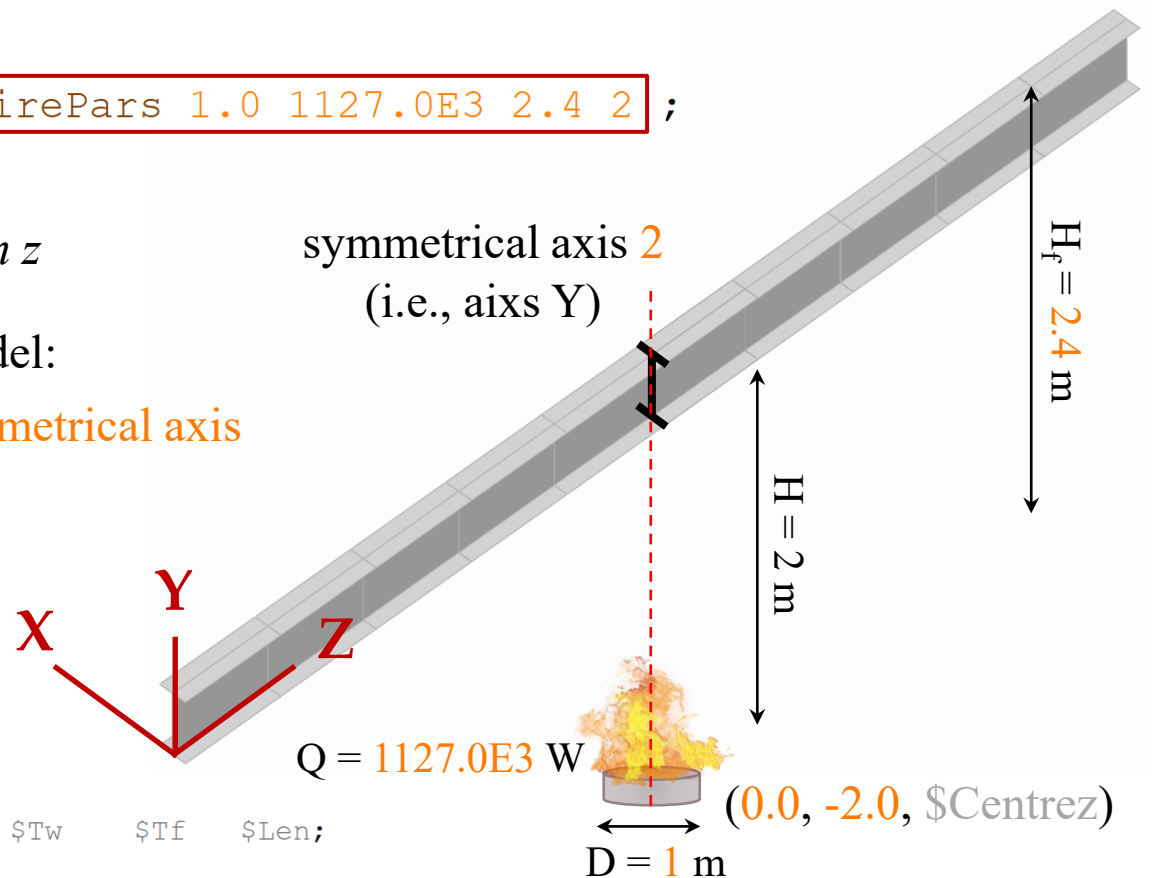

```
set Len 6.0; #Length of beam (m)
```

```
set Centrex 0.0
```

```
set Centrey [expr $HB/2.0]
```

```
set Centrez [expr $Len/2.0]
```

```
HTEntity Isection3D 1 $Centrex $Centrey $Centrez $BF $HB $Tw $Tf $Len;
```

## Set up localized fire model in OpenSEES

Considering effect of smoke via use **SetFirePars**

```
#Set(overwrite fire parameters)
```

```
SetFirePars firemodel 1 0.0 -2.0 $Centrez 1127.0E3 1.0 327 10E3;
```

```
# fireTag: 1
```

```
# locx (m): 0.0
```

```
# locy (m): -2.0
```

```
# locz (m): $Centrez
```

```
# Q (W): 1127.0E3
```

```
# Equivalen diameter of fire (m): 1.0
```

```
# Smoke temperature (°C): 327
```

```
# Additional heat flux (smoke induced, w/m2): 10E3
```

```
#FireModel - the Eurocode 1 Localised Fire Model
#$fireTType $fireTag $firePars
FireModel Localised 1 -origin 0.0 -2.0 $Centrez -firePars 1.0 1127.0E3 2.4 2 ;
```

# Set up localized fire model in OpenSEES

## Development of **Natural Fire Model**

Loading time-variant input fire parameters via external firepars.dat

```
#FireModel
```

```
#input parameters in firepars.dat
```

```
FireModel NaturalFire 6 -firePars -file firepars.dat 2;
```

**Flexibility & Maneuverability!**
